

Associated Relationship Type

The **Associated Relationship Type** mapping allows you to change the way your institution's associated relationship type types are categorized for organizing your constituent's relationship network. You can map each relationship type to one of the following options:

- Spouse
- Parent
- Child
- Other

Changes made to the Associated Relationship Type mapping will be reflected immediately in the Platform.

The Associated Relationship Type mapping table shows all of the codes you have defined, even if the codes are not in use (these will have 0 records). The table also shows all codes that are in use, even if a code definition was not found (Your Description will show "No Description Found").

Please note we may have built custom logic around your data if this was requested or necessary for implementing your data feed. If so, the codes and descriptions shown here may not match exactly what is in your system. Please contact [Support](#) with any questions about the information presented here.
